Churn Model for Pilot Program

8.0%

Churn Percent

Employee At-Risk Pilot Program

Identifying At-Risk Employees: Churn models can highlight employees who may be considering leaving, allowing HR to take proactive steps to address their concerns.

Understanding Turnover Causes: By analyzing factors that contribute to churn, HR can identify and address systemic issues in the organization, such as management practices, workload, or lack of career development opportunities.

Enhancing Employee Retention Strategies: Insights from these models can guide the development of targeted retention programs and policies.

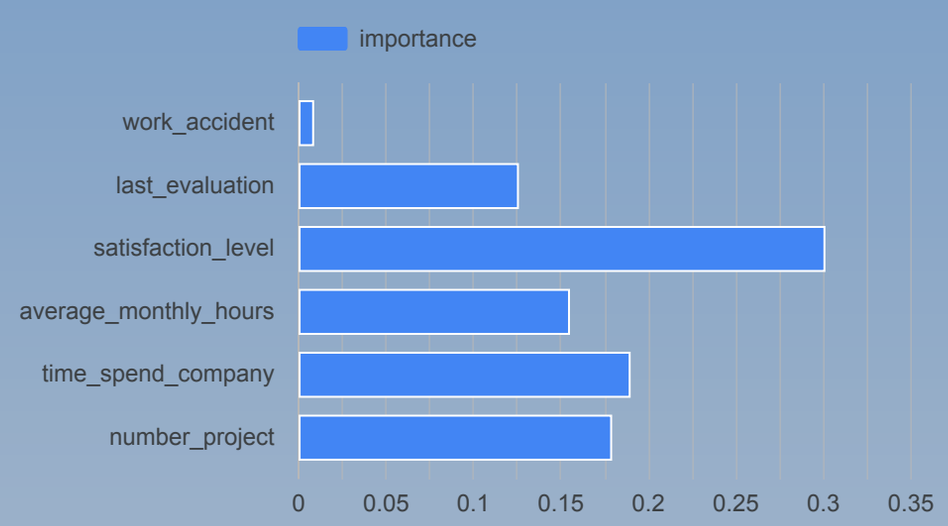
Average Satisfaction 0.5

Average Last Evaluation 0.47

Average Years at Company 3.39

Average Monthly Hours 213

What Is Driving Churn?



How The Algorithm Works:

The model found that the most crucial factor for predicting whether employees will stay or leave a company is their **reported job satisfaction**. The longer an employee has been with the company, the more projects they have, the more moderate number of hours they work, and the higher their performance evaluations, the more likely they are to stay. Surprisingly, whether or not they've had a work accident does not seem to have much of an impact on their decision to leave. This information can help the company focus on improving job satisfaction to retain valuable employees.
